

# Metal Chip Alchemy

Put more money on your company's bottom line by compacting your metal chips into briquettes

Does your company....

- create metal chips from aluminum, copper, brass, steel, or iron materials?
- face EPA issues related to metal chips?
- sell metal chips to scrap dealers?
- want to increase your remelt recovery rate?
- want to get paid for scrap?
- need to recover floor space used to store scrap metal chips?
- want to put more money on the bottom line?

## SOLVE your METAL CHIP ISSUES with METALBRIK

### MetalBrik can...

- **remove potentially hazardous metal working fluids for recycling.** 30,000 psi of force exerted on the chips releases up to 98% of all fluid attached. The removed fluid is collected in a containment tray located under the MetalBrik compression unit.
- **reduce chip specific labor costs.** MetalBrik will reduce the labor associated with transporting, sorting, and tracking metal chips, as well as constant clean-up of the chip collection area.
- **reduce EPA & state hazardous waste handling issues.** Integrating a MetalBrik system eliminates many of the handling requirements associated with the EPA's hazardous waste and used oil regulations.
- **assist with ISO 14001 compliance.** Your company will comply with ISO 14001 Environmental Management Standards for "zero discharge" with scrap and metal working fluid waste.
- **increase the value of scrap metal chips.** Dense, fluid free briquettes provide a higher recovery rate and are more efficient when remelted. In addition, the removal of fluid prevents excessive smoke or fire when briquettes are remelted.
- **save plant floor space by reducing metal chip volume.** By compacting metal chips into dense briquettes, MetalBrik reduces the volume of metal chips up to 20:1 (depending on material and chip type). Reducing metal chip volume results in a floor space reduction.

**Contact Neff Press or your MetalBrik sales representative for a no-obligation metal chip compaction analysis.**
